Diagonal 6.43 mm (Type 1/2.8) CMOS Solid-state Image Sensor with Square Pixel for Color Cameras

## Description

The IMX515-AAQN-C is a diagonal 6.4 mm (Type 1/2.8) CMOS active pixel type solid-state image sensor with a square pixel array and 8.46 M effective pixels. This chip operates with analog 2.9 V , digital 1.1 V , and interface 1.8 V triple power supply, and has low power consumption. High sensitivity, low dark current and no smear are achieved through the adoption of $R, G$ and $B$ primary color mosaic filters. This chip features an electronic shutter with variable charge-integration time.
(Applications: Surveillance cameras, FA cameras, Industrial cameras)

## Features

- CMOS active pixel type dots
- Built-in timing adjustment circuit, H/V driver and serial communication circuit
- Input frequency: $24 \mathrm{MHz} / 27 \mathrm{MHz} / 37.125 \mathrm{MHz} / 72 \mathrm{MHz} / 74.25 \mathrm{MHz}$
- Number of recommended recording pixels: $3840(\mathrm{H}) \times 2160(\mathrm{~V})$ approx. 8.29M pixel
- Readout mode

All-pixel scan mode
Horizontal / Vertical 2/2-line binning mode
Window cropping mode
Horizontal / Vertical direction - Normal / Inverted readout mode

- Readout rate

Maximum frame rate in
All-pixel scan mode: 12 bit: 52.2 frame/s, 10 bit: 61.6 frame/s

- High dynamic range (HDR) function

Multiple exposure HDR
Digital overlap HDR

- Synchronizing sensors function
- Variable-speed shutter function (resolution 1H units)
- CDS / PGA function

0 dB to 30 dB : Analog Gain 30 dB (step pitch 0.3 dB )
30.3 dB to 72 dB : Analog Gain 30 dB + Digital Gain 0.3 dB to 42 dB (step pitch 0.3 dB )

- Supports I/O

CSI-2 serial data output ( 2 Lane / 4 Lane ), RAW10 / RAW12 output

[^0]
## Device Structure

- CMOS image sensor
- Image size

Diagonal 6.4 mm (Type $1 / 2.8$ approx. 8.40 M pixels, All pixels

- Total number of pixels $3864(\mathrm{H}) \times 2228(\mathrm{~V})$
approx. 8.60 M pixels
- Number of effective pixels $3864(\mathrm{H}) \times 2192(\mathrm{~V})$
approx. 8.46 M pixels
- Number of active pixels $3864(\mathrm{H}) \times 2176(\mathrm{~V})$
approx. 8.40 M pixels
$\bullet$ Number of recommended recording pixels
$3840(\mathrm{H}) \times 2160(\mathrm{~V})$
approx. 8.29 M pixels
- Unit cell size
$1.45 \mu \mathrm{~m}(\mathrm{H}) \times 1.45 \mu \mathrm{~m}(\mathrm{~V})$
- Optical black

Horizontal (H) direction: Front 0 pixels, rear 0 pixels Vertical (V) direction: Front 36 pixels, rear 0 pixels

- Dummy

Horizontal (H) direction: Front 0 pixels, rear 0 pixels Vertical (V) direction: Front 1 pixels, rear 1 pixels

- Substrate material Silicon

## Absolute Maximum Ratings

| Item | Symbol | Min. | Max. | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage (analog: 2.9 V ) | AVDD | -0.3 | 3.3 | V |  |
| Supply voltage (interface: 1.8 V ) | OV ${ }_{\text {d }}$ | -0.3 | 3.3 | V |  |
| Supply voltage (digital: 1.1 V ) | DVDD | -0.3 | 2.0 | V |  |

## USE RESTRICTION NOTICE

This USE RESTRICTION NOTICE ("Notice") is for customers who are considering or currently using the image sensor products ("Products") set forth in this specifications book. Sony Semiconductor Solutions Corporation ("SSS") may, at any time, modify this Notice which will be available to you in the latest specifications book for the Products. You should abide by the latest version of this Notice. If a SSS subsidiary or distributor has its own use restriction notice on the Products, such a use restriction notice will additionally apply between you and the subsidiary or distributor. You should consult a sales representative of the subsidiary or distributor of SSS on such a use restriction notice when you consider using the Products.

## Use Restrictions

- The Products are intended for incorporation into such general electronic equipment as office products, communication products, measurement products, and home electronics products in accordance with the terms and conditions set forth in this specifications book and otherwise notified by SSS from time to time.
- You should not use the Products for critical applications which may pose a life- or injury-threatening risk or are highly likely to cause significant property damage in the event of failure of the Products. You should consult your sales representative beforehand when you consider using the Products for such critical applications. In addition, you should not use the Products in weapon or military equipment.
- SSS disclaims and does not assume any liability and damages arising out of misuse, improper use, modification, use of the Products for the above-mentioned critical applications, weapon and military equipment, or any deviation from the requirements set forth in this specifications book.

## Design for Safety

- SSS is making continuous efforts to further improve the quality and reliability of the Products; however, failure of a certain percentage of the Products is inevitable. Therefore, you should take sufficient care to ensure the safe design of your products such as component redundancy, anti-conflagration features, and features to prevent mis-operation in order to avoid accidents resulting in injury or death, fire or other social damage as a result of such failure.

## Export Control

- If the Products are controlled items under the export control laws or regulations of various countries, approval may be required for the export of the Products under the said laws or regulations. You should be responsible for compliance with the said laws or regulations.

## No License Implied

- The technical information shown in this specifications book is for your reference purposes only. The availability of this specifications book shall not be construed as giving any indication that SSS and its licensors will license any intellectual property rights in such information by any implication or otherwise. SSS will not assume responsibility for any problems in connection with your use of such information or for any infringement of third-party rights due to the same. It is therefore your sole legal and financial responsibility to resolve any such problems and infringement.

## Governing Law

- This Notice shall be governed by and construed in accordance with the laws of Japan, without reference to principles of conflict of laws or choice of laws. All controversies and disputes arising out of or relating to this Notice shall be submitted to the exclusive jurisdiction of the Tokyo District Court in Japan as the court of first instance.

## Other Applicable Terms and Conditions

- The terms and conditions in the SSS additional specifications, which will be made available to you when you order the Products, shall also be applicable to your use of the Products as well as to this specifications book. You should review those terms and conditions when you consider purchasing and/or using the Products.

Note) 1. Converted value into mV using 1Digit $=0.1465 \mathrm{mV}$ for 12 -bit output and 1 Digit $=0.5865 \mathrm{mV}$ for 10-bit output.
2. The video signal shading is the measured value in the wafer status (including color filter) and does not include characteristics of the seal glass.
3. The characteristics above apply to effective pixel area.
4. Since the measurement conditions are in transition, the old conditions are also described.

## Image Sensor Characteristics Measurement Method

## Measurement Conditions

1. In the following measurements, the device drive conditions are at the typical values of the bias conditions and clock voltage conditions.
2. In the following measurements, spot pixels are excluded and, unless otherwise specified, the optical black (OB) level is used as the reference for the signal output.

## Color Coding of Physical Pixel Array

The primary color filters of this image sensor are arranged in the layout shown in the figure below. Gr and Gb represent the $G$ signal on the same line as the $R$ and $B$ signals, respectively. The $R$ signal and $G r$ signal lines and the Gb signal and $B$ signal lines are output successively.

## Color Coding Diagram

## Definition of standard imaging conditions

- Standard imaging condition I:

Using a purple excitation LED light source with a color temperature of 2850 K , an IR cut filter CM700 ( $\mathrm{t}=1.0 \mathrm{~mm}$ ) is placed between the LED light source and the sensor receiving surface to irradiate substantially parallel light.

- Standard imaging condition II:

Image a light source (color temperature of 3200 K ) with a uniformity of brightness within $2 \%$ at all angles. Use a testing standard lens with CM700 ( $\mathrm{t}=1.0 \mathrm{~mm}$ ) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

- Standard imaging condition III:

Image a light source (color temperature of 3200 K ) with a uniformity of brightness within $2 \%$ at all angles. Use a testing standard lens with CM700 ( $\mathrm{t}=1.0 \mathrm{~mm}$ ) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

## Measurement Method

1. Sensitivity
[New measurement conditions]
Set the measurement condition to the standard imaging condition I , and calculate using the illuminance (Ev) of the sensor receiving surface, the signal values (VGr, VGb, VR, VB) at the center of the screen, and the integration time ( T ).

VG $=(\mathrm{VGr}+\mathrm{VGb}) / 2$
$\mathrm{Sg}=\mathrm{VG} /(\mathrm{Ev} \times \mathrm{T})[$ Digit $/ \mathrm{lx} / \mathrm{s}]$
[Old measurement conditions]
Set the measurement condition to the standard imaging condition I. After setting the electronic shutter mode with a shutter speed of $1 / 100 \mathrm{~s}$, measure the Gr and Gb signal outputs (VGr, VGb) at the center of the screen, and substitute the values into the following formula.
$\mathrm{S}=(\mathrm{VGr}+\mathrm{VGb}) / 2 \times 100 / 30[\mathrm{mV}]$
2. Sensitivity ratio

By using the $R$ and $B$ signal outputs (VR, VB) obtained from the sensitivity measurement, substitute the values into the following formulas.

RG = VR / VG
$B G=V B / V G$
3. Saturation signal

Set the measurement condition to the standard imaging condition II. After adjusting the luminous intensity to 20 times the intensity with the average value of the Gr and Gb signal outputs, 300 mV , measure the minimum values of the $\mathrm{Gr}, \mathrm{Gb}, \mathrm{R}$ and B signal outputs.
4. Video signal shading

Set the measurement condition to the standard imaging condition III. With the lens diaphragm at F2.8, adjust the luminous intensity so that the average value of the Gr and Gb signal outputs is 300 mV . Then measure the maximum value ( $\mathrm{Gmax}[\mathrm{mV}]$ ) and the minimum value ( $\mathrm{Gmin}[\mathrm{mV}]$ ) of the Gr and Gb signal outputs, and substitute the values into the following formula.
$\mathrm{SH}=(\mathrm{Gmax}-\mathrm{Gmin}) / 300 \times 100[\%]$
5. Vertical Line

With the device junction temperature of $60^{\circ} \mathrm{C}$ and the device in the light-obstructed state, calculates each average output of $\mathrm{Gr}, \mathrm{Gb}, \mathrm{R}$ and B on respective columns. Calculates maximum value of difference with adjacent column on the same color ( $\mathrm{VL}[\mu \mathrm{V}]$ ).
6. Dark signal

With the device junction temperature of $60^{\circ} \mathrm{C}$ and the device in the light-obstructed state, divide the output difference between $1 / 30$ s integration and $1 / 300 \mathrm{~s}$ integration by 0.9 , and calculate the signal output converted to $1 / 30 \mathrm{~s}$ integration. Measure the average value of this output (Vdt [mV]).
7. Dark signal shading

After the measurement item 6, measure the maximum value ( $\mathrm{Vdmax}[\mathrm{mV}]$ ) and the minimum value ( $\mathrm{Vdmin}[\mathrm{mV}]$ ) of the dark signal output, and substitute the values into the following formula.
$\Delta \mathrm{Vdt}=\mathrm{Vdmax}-\mathrm{Vdmin}[\mathrm{mV}]$

## Setting Registers Using Serial Communication

This sensor can write and read the setting values of the various registers shown in the Register Map by $I^{2} \mathrm{C}$ communication. See the Register Map for the addresses and setting values to be set.

## Description of Setting Registers ( $\mathbf{I}^{2} \mathrm{C}$ )

The serial data input order is MSB-first transfer. The table below shows the various data types and descriptions. Using SLAMODE0 and SLAMODE1 pins, SLAVE address can be changed.

Pin connection of serial communication

SLAVE Address

| SLAMODE1 <br> pin | SLAMODE0 <br> pin | MSB |  |  |  |  |  |  |  |  | LSB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Low | Low | 0 | 0 | 1 | 1 | 0 | 1 | 0 | R/W |  |  |
| Low | High | 0 | 0 | 1 | 0 | 0 | 0 | 0 | R/W |  |  |
| High | Low | 0 | 1 | 1 | 0 | 1 | 1 | 0 | R/W |  |  |
| High | High | 0 | 1 | 1 | 0 | 1 | 1 | 1 | R/W |  |  |

* $R / W$ is data direction bit

R / W

| R / W bit | Data direction |
| :---: | :--- |
| 0 | Write (Master to Sensor) |
| 1 | Read (Sensor to Master) |

${ }^{2} \mathrm{C}$ pin description

| Symbol | Pin No. | Remarks |
| :---: | :---: | :--- |
| SCL | E4 | $I^{2} \mathrm{C}$ serial clock input |
| SDA | G5 | $I^{2} \mathrm{C}$ serial data communication |

## Register Communication Timing ( $\mathbf{I}^{2} \mathrm{C}$ )

In $I^{2} \mathrm{C}$ communication system, communication can be performed during the period excluding the communication prohibited period (1 XHS period) shown below .
The registers whose reflection timing is " V " in the register map are reflected by the "Frame reflection register reflection timing" when communication is performed during the communication period shown in the figure below. Registers whose reflection timing is "l" (Immediately) are reflected when the communication is performed.
Using REGHOLD function is recommended for register setting using $I^{2} \mathrm{C}$ communication. For REGHOLD function, see item "Register Hold Setting" in section "Description of Various Functions".

## Communication Protocol

$1^{2} \mathrm{C}$ serial communication supports a 16 -bit register address and 8 -bit data message type.

## Communication Protocol

Data is transferred serially, MSB first in 8-bit units. After each data byte is transferred, A (Acknowledge) / $\overline{\mathrm{A}}$ (Negative Acknowledge) is transferred. Data (SDA) is transferred at the clock (SCL) cycle. SDA can change only while SCL is Low, so the SDA value must be held while SCL is High. The Start condition is defined by SDA changing from High to Low while SCL is High. When the Stop condition is not generated in the previous communication phase and Start condition for the next communication is generated, that Start condition is recognized as a Repeated Start condition.

Start Condition

Stop Condition

Repeated Start Condition

After transfer of each data byte, the Master or the sensor transmits an Acknowledge / Negative Acknowledge and releases (does not drive) SDA. When Negative Acknowledge is generated, the Master must immediately generate the Stop Condition and end the communication.

Acknowledge and Negative Acknowledge

## Register Write and Read $\left(I^{2} \mathrm{C}\right)$

This sensor supports the following four read operations and two write operations.

## Single Read from Random Location

The sensor has an index function that indicates which address it is focusing on. In reading the data at an optional single address, the Master must set the index value to the address to be read. For this purpose, it performs dummy write operation up to the register address. The upper level of the figure below shows the sensor internal index value, and the lower level of the figure shows the SDA I/O data flow. The Master sets the sensor index value to M by designating the sensor slave address with a write request, then designating the address ( M ). Then, the Master generates the start condition. The Start Condition is generated without generating the Stop Condition, so it becomes the Repeated Start Condition. Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge immediately followed by the index address data on SDA. After the Master receives the data, it generates a Negative Acknowledge and the Stop Condition to end the communication.

Single Read from Random Location

## Single Read from Current Location

After the slave address is transmitted by a write request, that address is designated by the next communication and the index holds that value. In addition, when data read/write is performed, the index is incremented by the subsequent Acknowledge/Negative Acknowledge timing. When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after Acknowledge. After receiving the data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication, but the index value is incremented, so the data at the next address can be read by sending the slave address with a read request.

Single Read from Current Location

## Sequential Read Starting from Random Location

In reading data sequentially, which is starting from an optional address, the Master must set the index value to the start of the addresses to be read. For this purpose, dummy write operation includes the register address setting. The Master sets the sensor index value to M by designating the sensor slave address with a read request, then designating the address (M). Then, the Master generates the Repeated Start Condition.
Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge followed immediately by the index address data on SDA. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA. This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication.

## Sequential Read Starting from Random Location

## Sequential Read Starting from Current Location

When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after the Acknowledge. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA.
This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication.

Sequential Read Starting from Current Location

## Single Write to Random Location

The Master sets the sensor index value to $M$ by designating the sensor slave address with a write request, and designating the address (M). After that the Master can write the value in the designated register by transmitting the data to be written. After writing the necessary data, the Master generates the Stop Condition to end the communication.

## Single Write to Random Location

## Sequential Write Starting from Random Location

The Master can write a value to register address $M$ by designating the sensor slave address with a write request, designating the address $(\mathrm{M})$, and then transmitting the data to be written. After the sensor receives the write data, it outputs an Acknowledge and at the same time increments the register address, so the Master can write to the next address simply by continuing to transmit data. After the Master writes the necessary number of bytes, it generates the Stop Condition to end the communication.

Sequential Write Starting from Random Location

## Register Map

This sensor has a total of $4352(256 \times 17)$ bytes of registers. Each register has an address consisting of the MSB address in the range 30 h to 40 h and the LSB address in the range 00 h to FFh . Use the default values for addresses not listed in the Register Map. Since there are registers that need to be changed from the default values, make sure that the sensor control side can set a total of 4352 bytes.

There are three different register reflection timings.
About the reflection timing column of the Register Map, registers noted as " $l$ " are reflected immediately after writing to register, registers noted as " S " are set during standby mode and reflected after standby cancel, registers noted as " V " are reflected at "Frame reflection register reflection timing" described in item "Register Communication Timing ( $\left.I^{2} \mathrm{C}\right)$ " in section "Setting Registers Using Serial Communication".

Do not communicate or set to an address not listed in the Register Map. Doing so may result in operation errors. However, registers may be added to addresses not currently listed in the Register Map, so be prepared to enable register communication for the entire range from addresses 3000h to 40FFh.

* For registers in which the description column is written in red, change the default value to the setting value written in red after reset.
** Only the gain setting is reflected and output in the frame that is delayed by one frame from the set frame.
*** Settings other than those described in the description column are prohibited.

## Readout Drive mode

## Operating mode

The table below shows the operating modes available with this sensor.
These frame rates indicate the maximum rates for each mode. For typical frame rates, see "List of Setting Register" in the section of "Image Data Output Format".

| Mode | Lane | Data rate [Mbps/Lane] | AD conversion [bit] | Output bit width [bit] | Frame rate [frame/s] | Recording Pixels |  | INCK <br> [MHz] | 1H period [Clock] | 1V period [XHS] |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | H [pixels] | V <br> [lines] |  |  |  |
| All-pixel | 2 | 1440 | 10 | 10 | 31.6 | 3840 | 2160 | 24, 72 | $1016{ }^{(* 2)}$ | 2238 |
|  |  | 891 | 10 | 10 | 19.8 |  |  | 27, 37.125, | $1668{ }^{(* 1)}$ |  |
|  |  | 891 | 12 | 12 | 16.6 |  |  | 74.25 | 1990 (*1) |  |

(*1) Clock frequency $=74.25[\mathrm{MHz}]$
(*2) Clock frequency $=72[\mathrm{MHz}]$

## Image Data Output Format (CSI-2 output)

## Frame Format

Each line of each image frame is output like the General Frame Format of CSI-2. Types of data in each line are shown below.

DATA Type

| Header [5:0] | Name | Setting register <br> $\left(I^{2} \mathrm{C}\right)$ | Description |
| :---: | :--- | :---: | :--- |
| 00 h | Frame Start Code | N/A | FS |
| 01 h | Frame End Code | N/A | FE |
| 12 h | Embedded Data | N/A | Embedded data |
| 2 h | RAW10 | Address: 3032 h | OA0Ah |
| 2 hn | RAW12 | MDBIT $[0]$ | OC0Ch |
| 37 h | OB Data | N/A | Vertical OB line data |

## Frame Structure

Frame Structure of CSI-2 output

## Embedded Data Line

The Embedded data line is output in a line following the sync code FS.
Embedded Data Format
Packet Header

RAW10

RAW12

The detailed output is shown below.

| Pixel (8bit) | bit | $\mathrm{I}^{2} \mathrm{C}$ address [HEX] | Data Byte Description | Description |
| :---: | :---: | :---: | :---: | :---: |
| 1 | [7:0] | - | - | ignored |
| 2 | [3:0] | 301C[3:0] | WINMODE |  |
| 3 | [3:0] | - | - | ignored |
|  | [4] | 3030[0] | HREVERSE |  |
|  | [6:5] | 3022[1:0] | ADDMODE |  |
|  | [7] | - | - | ignored |
| 4 to 8 | [7:0] | - | - | ignored |
| 9 | [4:0] | - | - | ignored |
|  | [5] | 3030[1] | VREVERSE |  |
|  | [7:6] | - | - | ignored |
| 10 | [7:0] | - | - | ignored |
| 11 | [5:0] | - | - | ignored |
|  | [7:6] | 3031[1:0] | ADBIT |  |
| 12 | [7:0] | - | - | ignored |
| 13 | [2:0] | 4001[2:0] | LANEMODE |  |
|  | [3] | 3032[0] | MDBIT |  |
|  | [7:4] | 3033[3:0] | SYS_MODE |  |
| 14 to 23 | [7:0] | - | - | ignored |
| 24 | [7:0] | 3050[7:0] | SHRO |  |
| 25 | [7:0] | 3051[7:0] |  |  |
| 26 | [3:0] | 3052[3:0] |  |  |
|  | [7:4] | - | - | ignored |
| 27 to 53 | [7:0] | - | - | ignored |
| 54 | [7:0] | 30E2[7:0] | BLKLEVEL |  |
| 55 | [1:0] | 30E3[1:0] |  |  |
|  | [7:2] | - | - | ignored |
| 56 to 216 | [7:0] | - | - | ignored |

Output data is Data[7:0] = 00h from 217 to 224 pixel.
Output data is Data[7:0] = 07h from 225 to end pixel.

## Image Data Output Format

The table below shows the register setting examples of typical frame rates.
For frame rates other than the typical frame rates, the frame rate can be calculated using the following formula.
Frame rate $[$ frame $/ \mathrm{s}]=1 /\left(\mathrm{V}_{\mathrm{TTL}} \times(1 \mathrm{H}\right.$ period $\left.)\right)$
$\mathrm{V}_{\mathrm{TTL}} \quad \begin{aligned} & \text { : Length of one frame in line units or VMAX } \\ & \\ & \text { "1V period" or more in the table of "Operating mode" }\end{aligned}$
1 H period (set in units $[\mathrm{s}]$ ) : " 1 H period" or more in the table of "Operating mode"

## All-pixel mode

List of Setting Register

| Address | bit | Register <br> Name | Initial <br> Value | CSI-2 serial / 2lane |  |  |  | Remarks |

Pixel Array Image Drawing in Horizontal/Vertical 2/2-line binning mode

Drive Timing Chart for Horizontal/Vertical 2/2-line binning mode

Pixels that are binned in the inverted operation are pixels that are shifted by one pixel among the same color as compared to pixels that are binned in the normal operation. For example, for consecutive red pixels R1, R2, and R3, R1 and R2 are binned in the normal operation, while R2 and R3 are binned in the inverted operation.

## Window Cropping Mode

In Window Cropping Mode, sensor signals are cropped and read out at an arbitrary position and width. This mode supports Horizontal / Vertical, normal / inverted readout mode for each of All-pixel mode, Horizontal/Vertical 2/2-line binning mode, Multiple exposure HDR and Digital overlap HDR.

The cropping area is designated by the cropping start position and width. The start position of the effective pixels including the dummy becomes the origin $(0,0)$ for specifying the cropping start position. The cropping start position is specified by the offset from the origin.
For the horizontal period after cropping, use the same value as the horizontal period for the drive mode before cropping. Pixels cropped by horizontal cropping are output left aligned. This extends the horizontal blanking period. Use the cropping position and width fixed. (An invalid frame is output when the cropping position or width is changed.)

Window cropping image is shown in the figure below.
When the setting values of cropping start position and width are the same, the same physical pixel area as All-pixel mode is cropped in Horizontal/Vertical 2/2-line binning mode, Multiple exposure HDR and Digital overlap HDR.
In the inverted mode, the readout operates so that it becomes the same "Recording pixel with Effective margin for color processing (green rectangle in the figure)" area as in the normal mode.

Image Drawing of Window Cropping Mode in Horizontal / Vertical, normal / inverted direction

Supplement) In the inverted mode of the Window cropping mode, the first readout pixel color is " $G$ ".

List of Setting Register

| Register | Register details |  | Initial <br> value | Setting value |  |
| :--- | :---: | :---: | :---: | :--- | :--- |

## Restrictions on Window cropping mode

The register settings must satisfy the following conditions.

## - WINMODE

Set WINMODE to 4h.

- PIX_VST, PIX_VWIDTH

Set PIX_VST and PIX_VWIDTH to multiples of 4.

$$
\begin{aligned}
& \text { PIX_VST }=n_{1} \times 4 \\
& \text { PIX_VWIDTH }=n_{2} \times 4
\end{aligned}
$$

Since the values of PIX_VST and PIX_VWIDTH are in units of internal V addresses, set PIX_VST and PIX_VWIDTH to twice the desired cropping start position and cropping width.

The range specified by PIX_VST and PIX_VWIDTH must include an extra 13 effective pixels in the front and 3 effective pixels in the rear in addition to the "Recording pixels with Effective margin for color processing" that you want to crop.

- PIX_HST, PIX_HWIDTH

Set PIX_HST to a multiple of 2.
Set PIX_HWIDTH to a multiple of 24 .

```
PIX_HST = n > × 2
PIX_HWIDTH = n4 × 24
```

Where $\mathrm{n}_{1}$ to $\mathrm{n}_{4}$ are integers greater than or equal to 0 .

- $V_{T T L}$
$V_{T T L}$ (length of one frame in line units or VMAX) $\geq($ PIX_VWIDTH / 2$)+46$

Set $V_{\text {TtL }}$ to 1222 or higher.
$V_{T T L} \geq 1222$

- Frame rate on Window cropping mode

Frame rate [frame/s] $=1 /\left(\mathrm{V}_{\mathrm{TTL}} \times(1 \mathrm{H}\right.$ period $\left.)\right)$
1 H period (set in units [s]) : Set "1H period" or more of the mode before cropping in the "Operating mode" table.

## Description of Various Functions

## Standby Mode

This sensor stops its operation and goes into standby mode which reduces power consumption by writing "1" to the standby control register STANDBY. Standby mode is also established after power-on or other system reset operation.

List of Standby Mode Setting

| Register | Register details |  | Initial | Retting value | Remarks |
| :--- | :---: | :---: | :---: | :--- | :--- |
|  | Address | bit |  | value |  |
| STANDBY | 3000 h | $[0]$ | 1 h | 1h: Standby <br> Oh: Operating | Register communication is <br> possible even during standby. |

The values of serial communication registers are retained even in standby mode, and the register values can be overwritten by serial communication. Therefore, standby mode can be canceled by setting the STANDBY register to " 0 ". After standby mode is canceled, it takes 24 ms for the internal regulator stabilization. After that, the frame output starts. Normal frames are output from the 9th frame.
For a detailed sequence of setting and canceling standby mode, see section "Sensor Setting Flow".

Sequence from Standby Cancel to Stable Image Output

## Slave Mode and Master Mode

The sensor can be switched between slave mode and master mode. The switching is made by the XMASTER register. Establish the XMASTER status before canceling standby mode. (Do not switch this register status during operation.)

When the sensor is in slave mode, input the vertical sync signal to the XVS pin and the horizontal sync signal to the XHS pin. The vertical sync signal interval should be equal to the number of lines per frame, and the horizontal sync signal interval should be 1H period determined for each operating mode. See the section of "Readout Drive mode" for the number of lines per frame and 1 H period.
After setting the master mode, set the register XMSTA to Oh to start the operation. In the master mode, the interval of the vertical sync signal to be generated is set in the VMAX [19:0] register in line units, and the interval of the horizontal sync signal is set in the HMAX [15:0] register in clock units. See the section of "Readout Drive mode" for details on setting each operating mode.

List of Slave and Master Mode Setting

| Register | Register details |  | Initial <br> value | Setting value |  |
| :---: | :---: | :---: | :---: | :--- | :--- |

List of Register in Master Mode

| Register | Register details |  | Initial value | Setting value | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Address | bit |  |  |  |

|  | 3025h | [7:0] |  |  |  |
|  | 3026h | [3:0] |  |  |  |
| HMAX [15:0] | 3028h | [7:0] | 0226h | See the item of each drive mode. | Number of clocks per line designated. |
|  | 3029h | [7:0] |  |  |  |
| XVSOUTSEL [1:0] | 30C0h | [1:0] | 2h | Oh: Fixed to Low 2h: VSYNC output |  |
| $\begin{aligned} & \text { XHSOUTSEL } \\ & {[1: 0]} \\ & \hline \end{aligned}$ |  | [3:2] | 2h | Oh: Fixed to Low 2h: HSYNC output |  |
| XVS_DRV [1:0] | 30C1h | [1:0] | 3h | Oh: XVS output (Master mode) <br> 3h: Hi-z (Slave mode) |  |
| XHS_DRV [1:0] |  | [3:2] | 3h | Oh: XHS output (Master mode) <br> 3h: Hi-z (Slave mode) |  |
| XVSLNG [1:0] | 30CCh | [5:4] | Oh | Oh: 1H, 1h: 2H, 2h: 4H, 3h: 8H | XVS low level pulse width designated. |
| XHSLNG [1:0] | 30CDh | [5:4] | Oh | Oh: 16clock, 1h: 32clock 2h: 64clock, 3h: 128clock See the next. | XHS low level pulse width designated. |

XVS and XHS output waveforms in sensor master mode

XVS and XHS are output when the register XMSTA is set to 0 . If XMSTA is set to 0 during standby, XVS and XHS are output just after canceling standby. The XVS and XHS are output asynchronous with other input or output signals. In addition, the output signals are output with an undefined latency time (system delay) relative to the XHS. Therefore, refer to the sync codes output from the sensor and perform synchronization.

## Gain Adjustment Function

The Programmable Gain Control (PGC) of this sensor consists of an analog part and a digital part. By setting the register GAIN_PGC_0 [8:0], it is possible to set a maximum of 72 dB in total of analog gain and digital gain. The setting is common to all colors.

Set the register to a value that is $10 / 3$ times the desired gain value. ( 0.3 dB step)
Example)
When set to $6 \mathrm{~dB}: 6 \times 10 / 3=20 \mathrm{~d}$; GAIN_PGC_0 $=14 \mathrm{~h}$
When set to $12.6 \mathrm{~dB}: 12.6 \times 10 / 3=42 \mathrm{~d} ;$ GAIN_PGC_0 $=2$ Ah

List of PGC Register

| Register | Register details |  | Initial value | Setting value | Remarks |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | Address | bit |  | Setting range |  |
| GAIN_PGC_0 <br> $[8: 0]$ | 3090 h | $[7: 0]$ | 000 h | $00 \mathrm{~h}-\mathrm{FOh}$ <br> $(0 \mathrm{~h}-240 \mathrm{~d})$ | Setting value: Gain $[\mathrm{dB}] \times 10 / 3$ <br> $(0.3 \mathrm{~dB}$ step $)$ |
|  | 3091 h | $[0]$ |  |  |  |

As shown below, the gain setting is reflected in the frame that is delayed by one frame from the communication.

Gain Reflection Timing

## Black Level Adjustment Function

The black level offset (offset variable range: 000h to 3FFh) can be added to the data for which the digital gain modulation has been performed by the BLKLEVEL [9:0] register.
Note that the offset unit changes according to the output bit setting.
When the output data length is 10 -bit output, increasing the register setting value by 1 h increases the black level by 1 LSB. When the output data length is 12 -bit output, increasing the register setting value by 1 h increases the black level by 4 LSB.

* Recommended setting

10-bit output: 032h (50d in LSB units)
12-bit output: 032h (200d in LSB units)

List of Black Level Adjustment Register

| Register | Register details |  | Initial value | Setting value |  |
| :--- | :---: | :---: | :---: | :--- | :---: |
|  | Address | bit |  |  |  |
| BLKLEVEL <br> $[9: 0]$ | $30 E 2 \mathrm{~h}$ | $[7: 0]$ | 032 h | 000 h to $3 F F \mathrm{~h}$ |  |
|  | 30 E 3 h | $[1: 0]$ |  |  |  |

## Normal Operation and Inverted Operation

The sensor readout direction (normal / inverted) in vertical direction can be switched by VREVERSE register and in horizontal direction can be switched by HREVERSE register. See the section of "Image Data Output Format" for the order of readout lines in normal and inverted modes, and for other register settings.
If the vertical readout direction is switched during streaming, one invalid frame occurs, while regarding the horizontal readout direction switching, no invalid frame occurs.

List of Drive Direction Setting Register

| Register | Register details |  | Initial value | Setting value |
| :---: | :---: | :---: | :---: | :---: |
|  | Address | bit |  |  |

## Shutter and Integration Time Settings

This sensor has a variable electronic shutter function that can control the integration time in line units. In addition, this sensor performs rolling shutter operation in which electronic shutter and readout operation are performed sequentially for each line.

Note) The frame that reflects the change in the integration time is output with a delay of one frame from the change.

## Example of Integration Time Setting

The sensor's integration time is obtained by the following formula.

## Integration time = 1 frame period $-\mathrm{SHRO} \times\left(1 \mathrm{H}\right.$ period) $+\mathrm{T}_{\text {offset }}$

Where Toffset is $1.79[\mu \mathrm{~s}]$ in AD 10bit mode and $2.68[\mu \mathrm{~s}]$ in AD 12bit mode.
*1 The frame period is determined by the input XVS when the sensor is operating in slave mode and by the register VMAX when the sensor is in master mode. Since the frame period is designated in 1 H units, it can be converted into time units using the formula (Number of lines $\times 1 \mathrm{H}$ period).
*2 See the section of "Readout Drive mode" for the 1 H period.

In this section, the shutter operation and integration time are shown as in the figure below with the time sequence on the horizontal axis and the vertical addresses on the vertical axis. For simplicity, shutter and readout operations are noted in line units.

Image Drawing of Shutter Operation

## Normal Exposure Operation (Controlling the Integration Time in 1H Units)

The integration time can be controlled by changing the electronic shutter timing. In the electronic shutter settings, the integration time is controlled by the SHRO [19:0] register. Set SHRO [19:0] to a value between 8 and (Number of lines per frame - 4). When the sensor is operating in slave mode, the number of lines per frame is determined by the XVS interval (number of lines), with the input XHS interval being one line unit. When the sensor is operating in master mode, the number of lines per frame is determined by the VMAX [19:0] register.
The number of lines per frame differs according to the operating mode.

Registers Used to Set the Integration Time in 1H Units

| Register | Register details |  | Initial value | Setting value |
| :---: | :---: | :---: | :---: | :---: |
|  | Address | bit |  |  |
| SHRO [19:0] | 3050h | [7:0] | 00066h | Shutter sweep time. <br> 8 to (Number of lines per frame - 4). <br> * Others: Setting prohibited. |
|  | 3051h | [7:0] |  |  |
|  | 3052h | [3:0] |  |  |
| VMAX [19:0] | 3024h | [7:0] | 008CAh | Number of lines per frame (only in master mode). See section "Readout Drive mode" for the setting value of each mode. |
|  | 3025h | [7:0] |  |  |
|  | 3026h | [3:0] |  |  |

Image Drawing of Integration Time Control within a Frame

## Long Exposure Operation (Controlled by Expanding the Number of Lines per Frame)

Long exposure operation can be performed by lengthening the frame period.
When the sensor is operating in slave mode, this is done by lengthening the input vertical sync signal (XVS) pulse interval.
When the sensor is operating in master mode, this is done by setting register VMAX [19:0] to a value greater than in normal operation. When the integration time is extended by increasing the number of lines, the rear V blanking increases by an equivalent amount.

The maximum exposure time in long exposure operation varies depending on the mode, but it is approximately 1 s . If a value that exceeds the number of V lines for each operating mode described in the "Readout Drive mode" section is set, the imaging characteristics are not guaranteed during long exposure operation.

Image Drawing of Long Integration Time Control by Adjusting the Frame Period

## Example of Integration Time Settings

The example of register settings for controlling the integration time is shown below.

Example of Integration Time Settings

| Operation | Sensor setting (register) |  | Integration time |
| :---: | :---: | :---: | :---: |
|  | VMAX $^{*}$ | SHRO** $^{*}$ |  |
| All-pixel scan mode | 2250 | 2246 | $4 \mathrm{H}+\mathrm{T}_{\text {offset }}$ |
|  |  | $\vdots$ | $\vdots$ |
|  |  | N | $(2250-\mathrm{N}) \mathrm{H}+\mathrm{T}_{\text {offset }}$ |
|  |  | $\vdots$ | $\vdots$ |
|  |  | 8 | $2242 \mathrm{H}+\mathrm{T}_{\text {offset }}$ |

Where $T_{\text {offset }}$ is $1.79[\mu \mathrm{~s}]$ in AD 10bit mode and $2.68[\mu \mathrm{~s}]$ in AD 12bit mode.

* VMAX is effective only in master mode. In slave mode, XVS input interval is used instead of VMAX.
** The range of $\operatorname{SHRO}(\mathrm{N})$ is " 8 " to "VMAX $(\mathrm{M})-4$ ".

## CSI-2 Output

The sensor supports the following output modes and output formats.
CSI-2 serial 2 Lane / 4 Lane, RAW10 / RAW12

The following describes the 2 Lane / 4 Lane serial signal output method of this sensor.
The image data of this sensor is output according to the CSI-2 interface. There is a total of 4 pairs of pins for the CSI-2 data signal output. The name of each pair is as follows. The DMO1P / DMO1N pair is called "Lane1". The DMO2P / DMO2N pair is called "Lane2". The DMO3P / DMO3N pair is called "Lane3". And the DMO4P / DMO4N pair is called "Lane4". In addition, the CSI-2 clock signal is output from the DCKP / DCKN pair. This pair is called "Clock Lane".
In 2 Lane mode, data is output from Lane1 and Lane2. In 4 Lane mode, data is output from Lane1, Lane2, Lane3 and Lane4.
The maximum bit rate is $1485 \mathrm{Mbps} / \mathrm{Lane}$ in 4 Lane mode and $1440 \mathrm{Mbps} /$ Lane in 2 Lane mode.
RAW10 / RAW12 is selectable by register MDBIT [0]. The number of data lanes used is set by register LANEMODE [2:0].
Unused lanes output according to the MIPI standard.

| Register | Register details |  | Initial <br> value | Setting value |  |
| :--- | :---: | :---: | :---: | :--- | :---: |
|  | Address | bit |  | Oh: RAW10 <br> 1h: RAW12 |  |

## MIPI Transmitter

The CSI-2 output pins (DMO1P, DMO1N, DMO2P, DMO2N, DMO3P, DMO3N, DMO4P, DMO4N, DCKP, DCKN) are described in this section.

Relationship between Pin Name and MIPI Output Lane

The pixel signals are output by the CSI-2 High-speed serial interface.
Refer to the MIPI Standard:

- MIPI Alliance Standard for Camera Serial Interface 2 (CSI-2) Version 1.2
- MIPI Alliance Specification for D-PHY Version 1.2

The CSI-2 transfers one bit with a pair of differential signals. The transmitter outputs differential current signal after converting pixel signals to it. Insert external resistance in differential pair in a series or use cells with a built-in resistance on the Receiver side. When inserting an external resistor, place it as close as possible to the Receiver. To avoid malfunction, the spacing between signal lines of a differential pair shall be kept constant, the wiring length difference between signal lines of a differential pair shall be minimum, and usage of meander wiring shall be kept to a minimum. The maximum bit rate of each Lane is $1485 \mathrm{Mbps} / \mathrm{Lane}$.

Universal Lane Module Functions

## Internal A/D Conversion Bit Width Setting

The internal A/D conversion bit width can be set to 10-bit or 12-bit by the register ADBIT [1:0]. Depending on the operating mode, the output is limited to 10-bit only. See the section of "Readout Drive mode" for the bit width supported by each mode.

List of Bit Width Selection

| Register | Register details |  | Initial value | Setting value |
| :--- | :---: | :---: | :---: | :--- |
|  | Address | bit |  | 0h: 10-bit <br> $1 \mathrm{~h}: 12$-bit |
| ADBIT | 3031 h | $[1: 0]$ | 1 h |  |

## Output Signal Range

In CSI-2 output mode, the sensor output has either a 10-bit or 12-bit gradation, and the maximum output value is 3FFh for 10-bit output and FFFh for 12-bit output.
The output range for each output gradation is shown in the table below.

Output Gradation and Output Range (CSI-2 output)

| Output gradation | Output value |  |
| :---: | :---: | :---: |
|  | Min. | Max. |
| 10 -bit | 000 h | $3 F F h$ |
| 12 -bit | 000 h | FFFh |

## INCK Setting

The available operation mode varies according to INCK frequency. Input $24 \mathrm{MHz}, 27 \mathrm{MHz}, 37.125 \mathrm{MHz}, 72 \mathrm{MHz}$ or 74.25 MHz for INCK frequency. The INCK setting registers and the list of INCK settings are shown in the table below.

In the MIPI Alliance Specification for D-PHY Version 1.2,
when operating above 1500 Mbps , an initial deskew sequence shall be transmitted before High-Speed Data
Transmission. When operating at or below 1500 Mbps , the transmission of the initial deskew sequence is optional. When operating at or above 1440 Mbps , this sensor transmits the initial deskew burst.

## INCK Setting Register

Data rate: 1485 Mbps/lane

## Register Hold Setting

By using the register REGHOLD, the settings of the frame reflection registers (registers whose reflection timing is "V" in the Register Map) can be transmitted in several frames and reflected in a certain frame at once. Registers set while REGHOLD is 1 are not reflected at the "Frame reflection register reflection timing". By setting REGHOLD to 0 in the frame where you want to reflect the registers, the registers set while REGHOLD is 1 are reflected at once.

Register Hold Setting Register

| Register | Register details |  | Initial value | Setting value |
| :---: | :---: | :---: | :---: | :--- |
|  | Address | bit |  | 0: Invalid <br> $1:$ Valid (Register hold) |
| REGHOLD | 3001 h | $[0]$ | $0 h$ |  |

Register Hold Setting

## Mode Transitions

The transitions between operation modes are shown below. These examples are when setting is completed in one communication period.

List of Mode Transition

| Transition |  |  | State |
| :---: | :---: | :---: | :---: |
| Horizontal direction normal | $\rightarrow$ | Horizontal direction inverted | Via the Standby state is unnecessary. |
| Horizontal direction inverted | $\rightarrow$ | Horizontal direction normal |  |
| All-pixel scan mode | $\rightarrow$ | Window cropping mode | Via the Standby state is unnecessary. One invalid frame is generated. |
| Window cropping mode | $\rightarrow$ | All-pixel scan mode |  |
| Vertical direction normal | $\rightarrow$ | Vertical direction inverted |  |
| Vertical direction inverted | $\rightarrow$ | Vertical direction normal |  |
| Vertical direction the number of lines change <br> (Master mode: VMAX change, Slave mode: XVS interval change) |  |  |  |
| Horizontal direction 1H period change (Master mode: HMAX change, Slave mode: XHS interval change) |  |  |  |
| - Transition between modes other than the above <br> - Change the input frequency of INCK *1 <br> - Change the register setting noted " S " in the reflection timing column of the Register Map. |  |  | Via the standby state is necessary. |

*1 When changing the input INCK frequency, be careful not to input a pulse shorter than the high / low level widths of the preceding and following INCK at the frequency switching. If the above pulse may occur at the INCK switching point, set the XCLR pin to Low level and change the INCK frequency during system reset. Then, set the XCLR pin to High level and perform system clear following the "Power-on sequence" in the section of "Power-on and Power-off Sequence". Execute initial setting again because the register settings become default state after system clear.

## Other Functions

This sensor has the following functions. For details, refer to each application note.

- Digital overlap HDR (2 / 3 frame)
- Multiple exposure HDR (2 / 4 frame)
- Additional Function of Synchronizing Sensors

## Power-on and Power-off Sequence

## Power-on sequence

1. Turn on the power supplies so that the power supplies rise in order of 1.1 V power supply ( DVDD ) $\rightarrow 1.8 \mathrm{~V}$ power supply ( OV VD ) $\rightarrow 2.9 \mathrm{~V}$ power supply ( AVDD ). In addition, all the power supplies should finish rising within 200 ms .
2. The register values are undefined immediately after power-on, so the system must be cleared. Hold XCLR at Low level for 500 ns or more after all the power supplies have finished rising. (The register values after a system clear are the default values.)
3. The system clear is applied by setting XCLR to High level. Input the maser clock after setting the XCLR pin to High level.
4. Make the sensor setting by register communication after the system clear.

## Power-on Sequence

| Item | Symbol | Min. | Max. | Unit |
| :--- | :---: | :---: | :---: | :---: |
| 1.1 V power supply rising $\rightarrow$ 1.8 V power supply rising | T0 | 0 | - | ns |
| 1.8 V power supply rising $\rightarrow$ 2.9 V power supply rising | T1 | 0 | - | ns |
| Rising time of all power supplies | T2 | - | 200 | ms |
| 2.9 V power supply rising $\rightarrow$ Clear OFF | TLow | 500 | - | ns |
| Clear OFF $\rightarrow$ INCK rising | T3 | 1 | - | $\mu \mathrm{s}$ |
| Clear OFF $\rightarrow$ Communication start | T4 | 20 | - | $\mu \mathrm{s}$ |
| Standby OFF (communication) <br> $\rightarrow$ External input XHS, XVS (slave mode only) | TsYnc | 24 | - | ms |

## Slew Rate Limitation of Power-on Sequence

Conform the slew rate limitation shown below while a power supply ramps up from 0 V to $100 \%$ of its voltage in the power-on sequence.

| Item | Symbol | Power supply | Min. | Max. | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Slew rate | SR | $\mathrm{DV} \mathrm{VD}_{\mathrm{DD}}(1.1 \mathrm{~V})$ | - | 25 | $\mathrm{mV} / \mu \mathrm{s}$ |  |
|  |  | $\mathrm{OV} \mathrm{VDD}_{\mathrm{DD}}(1.8 \mathrm{~V})$ | - | 25 | $\mathrm{mV} / \mu \mathrm{s}$ |  |
|  |  | $\mathrm{AV}(2.9 \mathrm{~V})$ | - | 25 | $\mathrm{mV} / \mu \mathrm{s}$ |  |

## Power-off sequence

Turn off the power supplies so that the power supplies fall in order of 2.9 V power supply ( AVDD ) $\rightarrow 1.8 \mathrm{~V}$ power supply ( OV DD ) $\rightarrow 1.1 \mathrm{~V}$ power supply ( DVDD ). In addition, all power supplies should finish falling within 200 ms . Set each digital input pin (INCK, SDA, SCL, XCLR, XVS, XHS) to 0 V before the 1.8 V power supply (OVdD) falls.

Power-off Sequence

| Item | Symbol | Min. | Max. | Unit |
| :--- | :---: | :---: | :---: | :---: |
| 2.9 V power shut down $\rightarrow 1.8 \mathrm{~V}$ power shut down | T 5 | 0 | - | ns |
| 1.8 V power shut down $\rightarrow 1.1 \mathrm{~V}$ power shut down | T 6 | 0 | - | ns |
| Shut down time of all power supplies | T 7 | - | 200 | ms |

## Sensor Setting Flow

## Setting Flow in Sensor Slave Mode

The figure below shows operating flow in sensor slave mode.
For details from "Power-on" to "System clear", see the item of "Power-on sequence" in this section.
For details from "Standby cancel" to "Wait for image stabilization", see the item of "Standby Mode".
"Standby setting (power save mode)" can be made by setting the STANDBY register to "1" during "Operation".

Sensor Setting Flow (Sensor Slave Mode)

## Setting Flow in Sensor Master Mode

The figure below shows operating flow in sensor master mode.
For details from "Power-on" to "System clear", see the item of "Power-on sequence" in this section.
For details from "Standby cancel" to "Wait for image stabilization", see the item of "Standby Mode".
In master mode, "Master mode starts" by setting register XMSTA to " 0 " after "Waiting for internal regulator stabilization".
"Standby setting (power save mode)" can be made by setting the STANDBY register to " 1 " during "Operation". At this time, set "Master mode stop" by setting XMSTA to " 1 ".

## Peripheral Circuit

Application circuits shown are typical examples illustrating the operation of the devices.
Sony Semiconductor Solutions Corporation cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party and other right due to same.

## Spot Pixel Specifications

$\left(A V_{D D}=2.9 \mathrm{~V}, \mathrm{OV}_{\mathrm{DD}}=1.8 \mathrm{~V}, \mathrm{DV}_{\mathrm{DD}}=1.1 \mathrm{~V}, \mathrm{Tj}=60^{\circ} \mathrm{C}, 30\right.$ frame $/ \mathrm{s}$, Gain: 0 dB$)$

Note) 1. Zone is specified based on all-pixel drive mode
2. D...Spot pixel level
3. See the Spot Pixel Pattern Specifications for the use of spot pixels that are close to each other.

## Zone Definition

## Notice on White Pixels Specifications

After delivery inspection of CMOS image sensors, particle radiation such as cosmic rays etc. may distort pixels of CMOS image sensors, and then distorted pixels may cause white point effects in dark signals in picture images. (Such white point effects shall be hereinafter referred to as "White Pixels".)
Unfortunately, it is not possible with current scientific technology for CMOS image sensors to prevent such White Pixels. It is recommended that when you use CMOS image sensors, you should consider taking measures against such White Pixels, such as adoption of automatic compensation systems for White Pixels in dark signals and establishment of quality assurance standards.
Unless the Seller's liability for White Pixels is otherwise set forth in an agreement between you and the Seller, Sony Semiconductor Solutions Corporation or its distributors (hereinafter collectively referred to as the "Seller") will, at the Seller's expense, replace such CMOS image sensors, in the event the CMOS image sensors delivered by the Seller are found to be to the Seller's satisfaction, to have over the allowable range of White Pixels as set forth above under the heading "Spot Pixels Specifications", within the period of three months after the delivery date of such CMOS image sensors from the Seller to you; provided that the Seller disclaims and will not assume any liability after you have incorporated such CMOS image sensors into other products.
Please be aware that Seller disclaims and will not assume any liability for (1) CMOS image sensors fabricated, altered or modified after delivery to you, (2) CMOS image sensors incorporated into other products, (3) CMOS image sensors shipped to a third party in any form whatsoever, or (4) CMOS image sensors delivered to you over three months ago. Except the above mentioned replacement by Seller, neither Sony Semiconductor Solutions Corporation nor its distributors will assume any liability for White Pixels. Please resolve any problem or trouble arising from or in connection with White Pixels at your costs and expenses.

## [For Your Reference] The Annual Number of White Pixels Occurrence

The chart below shows the predictable data on the annual number of White Pixels occurrence in a single-story building in Tokyo at an altitude of 0 meters. It is recommended that you should consider taking measures against the annual White Pixels, such as adoption of automatic compensation systems appropriate for each annual number of White Pixels occurrence.
The data in the chart is based on records of past field tests, and signifies estimated number of White Pixels calculated according to structures and electrical properties of each device. Moreover, the data in the chart is for your reference purpose only, and is not to be used as part of any CMOS image sensor specifications.

Example of Annual Number of Occurrence

| White Pixel Level (in case of integration time $=1 / 30 \mathrm{~s}$ ) $\left(\mathrm{T}=60^{\circ} \mathrm{C}\right)$ | Annual number of occurrence |
| :---: | :---: |
| 5.6 mV or higher | 42 pcs |
| 10.0 mV or higher | 23 pcs |
| 24.0 mV or higher | 10 pcs |
| 50.0 mV or higher | 4 pcs |
| 72.0 mV or higher | 3 pcs |

Note 1) The above data indicates the number of White Pixels occurrence when a CMOS image sensor is left for a year.
Note 2) The annual number of White Pixels occurrence fluctuates depending on the CMOS image sensor storage environment (such as altitude, geomagnetic latitude and building structure), time (solar activity effects) and so on. Moreover, there may be statistic errors. Please take notice and understand that this is an example of test data with experiments that have being conducted over a specific time period and in a specific environment.
Note 3) This data does not guarantee the upper limits of the number of White Pixels occurrence.

## Measurement Method for Spot Pixels

After setting to standard imaging condition II, and the device driver should be set to meet bias and clock voltage conditions. Configure the drive circuit according to the example and measure.

1. Black or white pixels at high light

After adjusting the luminous intensity so that the average value VG of the $\mathrm{Gb} / \mathrm{Gr}$ signal outputs is 300 mV , measure the local dip point (black pixel at high light, $\mathrm{V}_{\mathrm{iB}}$ ) and peak point (white pixel at high light, $\mathrm{V}_{\mathrm{i}}$ ) in the $\mathrm{Gr} /$ $\mathrm{Gb} / \mathrm{R} / \mathrm{B}$ signal output $\mathrm{Vi}(\mathrm{i}=\mathrm{Gr} / \mathrm{Gb} / \mathrm{R} / \mathrm{B})$, and substitute the value into the following formula.

Spot pixel level $D=\left(\left(\mathrm{V}_{\mathrm{iB}}\right.\right.$ or $\left.\mathrm{V}_{\mathrm{iK}}\right) /$ Average value of $\left.\mathrm{Vi}_{\mathrm{i}}\right) \times 100[\%]$

Signal output waveform of R / G / B channel
2. White pixels in the dark

Set the device to a dark setting and measure the local peak point of the signal output waveform, using the average value of the dark signal output as a reference.
3. Black pixels at signal saturated

Set the device to operate in saturation and measure the local dip point, using the OB output as a reference.

Signal output waveform of R / G / B channel

## Spot Pixel Pattern Specifications

White Pixel, Black Pixel, and Bright Pixel are judged from the pattern whether they are allowed or rejected, and counted.

List of White Pixel, Black Pixel, and Bright Pixel Patterns

Note) 1. "○" shows the position of white pixel, black pixel, or bright pixel.
Each pattern is defined by three white pixels, three black pixels, or three bright pixels.
(Example: If one black pixel and two white pixels are located like pattern No.1, they are not judged to be rejected.)
2. Products that have one or more rejected patterns are filtered out.
3. All spot pixels are subject to the "Maximum distorted pixels in each zone" judgment in the section of "Spot Pixel Specifications" even if they do not correspond to the patterns in the table above.

Marking

Note 1) Year code shall be arranged in A part.
2) Month code shall be arranged in B part.
3) WID(SIice No.) shall be arranged in C part.
4) Lot No. shall be arranged in D to e part.

DRAWING No. AM-C515AAQN

## Notes On Handling

## 1. Static charge prevention

Image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.
(1) Either handle bare handed or use non-chargeable gloves, clothes or material.

Also use conductive shoes.
(2) Use a wrist strap when handling directly.
(3) Install grounded conductive mats on the floor and working table to prevent the generation of static electricity.
(4) lonized air is recommended for discharge when handling image sensors.
(5) For the shipment of mounted boards, use boxes treated for the prevention of static charges.

## 2. Protection from dust and dirt

Image sensors are packed and delivered with care taken to protect the element glass surfaces from harmful dust and dirt. Clean glass surfaces with the following operations as required before use.
(1) Perform all lens assembly and other work in a clean environment (class 1000 or less).
(2) Do not touch the glass surface with hand and make any object contact with it.

If dust or other is stuck to a glass surface, blow it off with an air blower.
(For dust stuck through static electricity, ionized air is recommended.)
(3) Clean with a cotton swab with ethyl alcohol if grease stained. Be careful not to scratch the glass.
(4) Keep in a dedicated case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
(5) When a protective tape is applied before shipping, remove the tape applied for electrostatic protection just before use. Do not reuse the tape.

## 3. Installing (attaching)

(1) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.
(2) The adhesive may cause the marking on the rear surface to disappear.
(3) If metal, etc., clash or rub against the package surface, the package may chip or fragment and generate dust.
(4) Acrylate anaerobic adhesives are generally used to attach this product. In addition, cyanoacrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives to hold the product in place until the adhesive completely hardens. (Reference)
(5) Note that the sensor may be damaged when using ultraviolet ray and infrared laser for mounting it.

## 4. Reflow soldering conditions

The following items should be observed for reflow soldering.
(1) Recommended temperature profile for reflow soldering

| Control item | Profile (at part side surface) |
| :--- | :--- |
| 1. Preheating | 150 to $180^{\circ} \mathrm{C}$ <br> 60 to 120 s |
| 2. Temperature up (down) | $+4^{\circ} \mathrm{C} / \mathrm{s}$ or less $\left(-6^{\circ} \mathrm{C} / \mathrm{s}\right.$ or less) |
|  | Over $230^{\circ} \mathrm{C}$ <br> 10 to 30 s <br> Max. $5^{\circ} \mathrm{C} / \mathrm{s}$ |
| 3. Reflow temperature | Max. $240 \pm 5^{\circ} \mathrm{C}$ |
| 4. Peak temperature |  |

(2) Reflow conditions
(a) Make sure the temperature of the upper surface of the seal glass resin adhesive portion of the package does not exceed $245^{\circ} \mathrm{C}$.
(b) Perform the reflow soldering only one time.
(c) Finish reflow soldering within 72 h after unsealing the degassed packing.

Store the products under the condition of temperature of $30^{\circ} \mathrm{C}$ or less and humidity of $70 \% \mathrm{RH}$ or less after unsealing the package.
(d) Perform re-baking only one time under the condition at $125^{\circ} \mathrm{C}$ for 24 h .
(e) Note that condensation on glass or discoloration on resin intefaces may occur if the actual temperature and time exceed the conditions mentioned above.
(3) Others
(a) Carry out evaluation for the solder joint reliability in your company.
(b) After the reflow, the paste residue of protective tape may remain around the seal glass. (The paste residue of protective tape should be ignored except remarkable one.)
(c) Note that X-ray inspection may damage characteristics of the sensor.

## 5. Others

(1) Do not expose to strong light (sun rays) for long periods, as the color filters of color devices will be discolored.
(2) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or use in such conditions.
(3) This product is precision optical parts, so care should be taken not to apply excessive mechanical shocks or force.
(4) Note that imaging characteristics of the sensor may be affected when approaching strong electromagnetic wave or magnetic field during operation.
(5) Note that image may be affected by the light leaked to optical black when using an infrared cut filter that has transparency in near infrared ray area during shooting subjects with high luminance.
(6) Please perform the tilt adjustment for the optical axis in your company as required.

## List of Trademark Logos and Definition Statements

## STARVIS

* STARVIS is a trademark of Sony Corporation. The STARVIS is back-illuminated pixel technology used in CMOS image sensors for surveillance camera applications. It features a sensitivity of 2000 mV or more per $1 \mu \mathrm{~m}^{2}$ (color product, when imaging with a $706 \mathrm{~cd} / \mathrm{m}^{2}$ light source, F5.6 in 1 s accumulation equivalent), and realizes high picture quality in the visible-light and near infrared light regions.

## Revision History

| Date (Y / M / D) | Rev. | Page | Description |
| :---: | :---: | :---: | :---: |
| 2019 / 06 / 13 | 0.1 | - | Limited Edition (Not for Customer) |
| 2020 / 08 / 05 | 0.2 | - | First Edition |
| 2021/02/01 | E21110 | - | First Edition (Official Edition) |
|  |  | 1 | Added: Copyright 2021 |
|  |  | 7 | Update: TBD data <br> Tolerance values of the Optical Center diagram |
|  |  | 14 | Update: TBD data Current Consumption values |
|  |  | 21 | Update: TBD <br> Spectral Sensitivity Characteristics diagram |
|  |  | 22 | Update: TBD data <br> Image Sensor Characteristics table <br> Added: Item of G sensitivity (Old measurement conditions) in table |
|  |  | 24 | Update: TBD data <br> Values of Measurement Method <br> Added: Item of Old measurement conditions in "1. Sensitivity" |
|  |  | 43 to 44 | Added: Register Map items Registers are added to the addresses of (4) 34 ** h , (5) 35 ** h , (7) $37^{* *} \mathrm{~h}$, and (9) 39 ** h |
|  |  | 47 | Correction: Values of Operationg mode table Frame rate and 1 H period value in Horizontal/Vertical 2/2-line binning mode |
|  |  | 58 | Correction: Window Cropping Mode diagram Calculation formula in Image Drawing of Window Cropping Mode in inverted direction |
|  |  | 85 | Update: TBD data <br> Values of Spot Pixel Specifications table |
|  |  | 86 | Update: TBD data Values of Notice on White Pixels Specifications table |
|  |  | 87 | Update: TBD data Values of Measurement Method for Spot Pixels |
|  |  | 88 | Correction: The pattern diagram in Spot Pixel Pattern Specifications |
|  |  | 89 | Update: TBD Marking diagram |
|  |  | 92 | Update: TBD <br> Package Outline diagram |
